

# Republic Crystal Cube Spheres: Executive Summary

Oct 1, 2026 · @Paul Rodriguez

Republic Crystal Cube Spheres is a free web page that gathers the Republic's public resources into one place members can browse. It holds no private records: every document, video and link it shows is already publicly available, and the page simply organizes them. A single spreadsheet holds the list of what appears, so updates reach every member at once without anyone editing the page itself.

## What it does

Members open one page and find the Republic's materials grouped into colored "spheres" of tiles, instead of hunting across many websites.

- **Republic Resource Library:** founding documents, historical records and reference works, gathered by topic.
- **Search Everything:** one search box across every tile and library item.
- **Newsletters:** the newest issue on its button, with the full archive behind it.
- **Timeline Poster and Statehood of the united States:** visual references for history and statehood.
- **Media:** videos and images open inside the page.
- **Learning games:** Republic Trivia and Fact or Fiction.
- **Announcements banner:** short notices from administrators, aimed at a state or at everyone.
- **Optional add-ons:** members may choose to add tools such as the EB emergency module or Republic Pantry. They are off unless a member turns them on, and can be removed with one tap.

It works on desktop computers, iPhones and Android phones.

## Where the information comes from

Everything the page shows is public. Spheres adds no new information; it collects what is already open to anyone and puts it in one organized place.

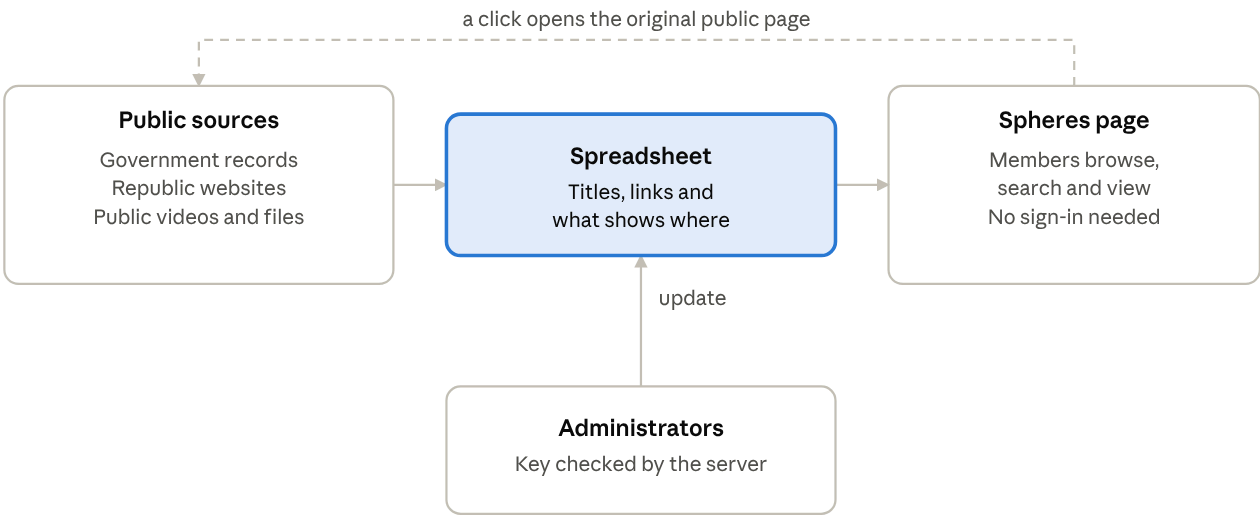

| Kind of source                   | Examples linked in the tool                                                                                                                            |
|----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| U.S. government records          | National Archives, Library of Congress, Congress.gov, Federal Register, GovInfo, U.S. Code, GPO, CRS Reports, FEMA, Department of Defense publications |
| Legal and reference works        | Cornell Law School's Legal Information Institute, Wikipedia, historic texts such as the Secret Journals of Congress and Webster's 1828 Dictionary      |
| The Republic's own public pages  | republicfortheunitedstatesofamerica.org, republicforusa.org, published newsletters                                                                     |
| Public video and social channels | YouTube, Rumble, Odysee, Vimeo, X, Facebook, Truth Social, Telegram                                                                                    |
| Publicly shared files            | Documents and images shared publicly from Google Drive                                                                                                 |

Sponsors (SmartDMS and Thee Carpenter's Workshop Foundation) appear as labeled links only. The page sends them nothing; they see a visitor only if a member clicks through to their website.

## How it works

The spreadsheet is a table of contents: it holds titles and links, not the documents themselves.

Spheres lists public sources; a spreadsheet holds the list

how Spheres works · 4 parts

When a member clicks a tile, the original public page or file opens. Administrators update the spreadsheet, and every member sees the change the next time the page loads.

Privacy and control

The tool stores no member records, passwords or private documents. Browsing the board requires no sign-in and sends nothing that identifies the member.

The only information that ever leaves a member’s device:

| What                                                                            | When                                                     | Where it goes                                                            |
|---------------------------------------------------------------------------------|----------------------------------------------------------|--------------------------------------------------------------------------|
| An anonymous daily count (a random device number and the app version, no name)  | Once a day when the page opens                           | The spreadsheet, so administrators can see how many devices use the tool |
| Name, state, email and a short message                                          | Only if the member fills in <b>Please contact me</b>     | The spreadsheet, so someone can reply                                    |
| A scrambled ID and state; location only if the member ticks "share my location" | Only if the member adds the optional EB emergency module | The EB service on the Republic’s Cloudflare account                      |

**Who can change what.** Members can only view. Changing tiles, newsletters or the banner requires an administrator key that is checked by the spreadsheet's server, not stored in the page. A copy of the file therefore carries no administrator power, and passing it on does not expose any keys.

The file was reviewed on October 1, 2026 before this copy was made. It contains no member data, no passwords that are in use, and no keys for outside services.

## Version and how to open it

|                               |                                                                                        |
|-------------------------------|----------------------------------------------------------------------------------------|
| Version                       | 4.68.1                                                                                 |
| Live address (always current) | republic-spheres.pjrodriguez12.workers.dev                                             |
| File copy                     | crystal-sphere4-v4.68.1-president.html: opens in any web browser by double-clicking it |
| Cost to members               | Free                                                                                   |

The live address is the recommended way in, because it always shows the newest version. The file copy shows the same live content but stays at version 4.68.1 until a newer file is sent.
